MOLD BUSTERS

Hackathon starter pack

Two jobs. Many ways to improve how the business works.

What is included

Case 01: an on-site house inspection in Ontario. A 21-page reference report, 21 photographs, a readable job story and a structured JSON timeline.

Case 02: a virtual apartment assessment in Quebec. A 12-page reference report, 3 photographs, a silent 2m56s walkthrough, a readable job story and a structured JSON timeline.

Where to start

1. Read either Job_Story.pdf to understand the case.

2. Load job_timeline.json for the workflow, systems, findings and estimates.

3. Use photographs and the silent walkthrough as sample inputs. Keep the reference report aside when testing report generation.

4. Build one useful improvement and show a before-and-after example.

The whole business is open

These inspection cases are a starting point. You can work on customer service, booking, scheduling, reporting, sales follow-up, data quality, administration or another useful part of Mold Busters.

What these records reveal

- Information moves between booking calendars, Brain, email, Asana, FreshBooks, Close CRM, Dialpad and field communications.

- The on-site visit is recorded at Oct 6, 11:30, with the report emailed Oct 8, 09:05: an elapsed gap of 45 hours 35 minutes. This is not a measurement of staff labor.

- The virtual call started at 11:30, with the report emailed at 13:00 the same day. The original call is about 19 minutes.

- Follow-up messages were sent and estimates viewed, with no acceptance recorded at the snapshot date.

Build with the evidence

Useful things to explore

- Connect the job timeline and flag missing next steps.

- Draft a report with evidence links to the source photographs.

- Detect conflicting appointment times, staff assignments or booking notes.

- Improve follow-up using the actual stage and unanswered questions.

These are suggestions. Teams are welcome to choose a different problem.

Known limits

The case notes record timezone and staff-assignment mismatches. The on-site booking record was created Oct 1 but its note refers to an earlier booking date. Treat these as inconsistencies to flag, not facts to silently correct.

The virtual recording has very small camera tiles. Its enlarged walkthrough remains low resolution. The three source stills are sharper; use them when evaluating image detail.

These two cases support prototypes and examples. They do not establish representative accuracy, general performance or a production-ready diagnosis system. Reports are reference outputs from the records and may contain inconsistencies.

Show a fair comparison

Use the same realistic task before and after. State what you measured, what you assumed, and what is simulated. Include AI usage costs and remaining human steps when estimating value. Keep known reference outputs out of the test inputs.

What was removed for this copy

Direct client identifiers, exact addresses, the postal code, original transaction IDs and identifying property-cover images have been removed or replaced. Staff names use stable aliases. PDF links, attachments and original document metadata were stripped. The full call with participant faces and all call audio are excluded. The walkthrough is silent.

Dates, prices, workflow steps, professional findings and source photographs remain for context. The original archive is unchanged. No live system access is included.

Full file notes are in README.txt.
